

Xamarin Forms – Day 1

Project description

In this project, you build a single page Xamarin Forms app, *MovieSearch*, with the following functionality:

1. The user enters words in a title of a (some) movie(s).
2. The words are used as an http query into a movie database (web service), which returns a collection of movies that match the given query.
3. Meanwhile, an *ActivityIndicator* should be shown.
4. The app displays the first movie title found.

The UI should look (something like) this (for iOS):

For communicating with the web service, you should be able to use your code from the PCL and/or a shared project.
